This ARTIX-7 FPGA development platform (Module: AX7A035) adopts the core board + carrier board mode, which is convenient for users to use the core board for secondary development.

In the design of carrier board, we have extended a wealth of interfaces for users, such as 1 PCIe2 interface, 2 SFP cage, 1 HDMI Output interface, 1 HDMI Input interface, 1 Gigabit Ethernet interface, Uart Interface, SD card slot etc. It meets user's requirements for PCIe high-speed data exchange, video transmission processing and industrial control. It is a "Versatile" ARTIX-7 FPGA development platform. It provides the possibility for high-speed video transmission, pre-validation and post-application of network, fiber and PCIe communication and data processing. This product is very suitable for students, engineers and other groups engaged in ARTIX-7 FPGA development.

## Part 1: FPGA Development Board Introduction

The entire structure of the AX7A035 FPGA development board is inherited from our consistent core board + carrier board model. A high-speed inter-board connector is used between the core board and the carrier board.

The core board is mainly composed of FPGA + 2 DDR3 + QSPI FLASH, which undertakes the functions of high-speed data processing and storage of FPGA, high-speed data reading and writing between FPGA and two DDR3s, data bit width is 32 bits, and the bandwidth of the whole system is up to 25Gb./s(800M\*32bit); The two DDR3 capacities are up to 8Gbit, which meets the need for high buffers during data processing. The selected FPGA is the XC7A35T chip of XILINX's ARTIX-7 series, in BGA 484 package. The communication frequency between the XC7A35T and DDR3 reaches 400Mhz and the data rate is 800Mhz, which fully meets the needs of high-speed multi-channel data processing. In addition, the XC7A35T FPGA features four GTP high-speed transceivers with speeds up to 6.6Gb/s per channel, making it ideal for fiber-optic communications and PCIe data communications.

The AX7A035 carrier board expands its rich peripheral interface, including 1 PClex2 interface, 2 SFP Interface, 1 HDMI Output interface, 1 HDMI Input interface, 1 Uart Interface, 1 Gigabit Ethernet interfaces, 1 SD card slot, 2-way 40-pin expansion header, some Keys, LED and EEPROM circuit.

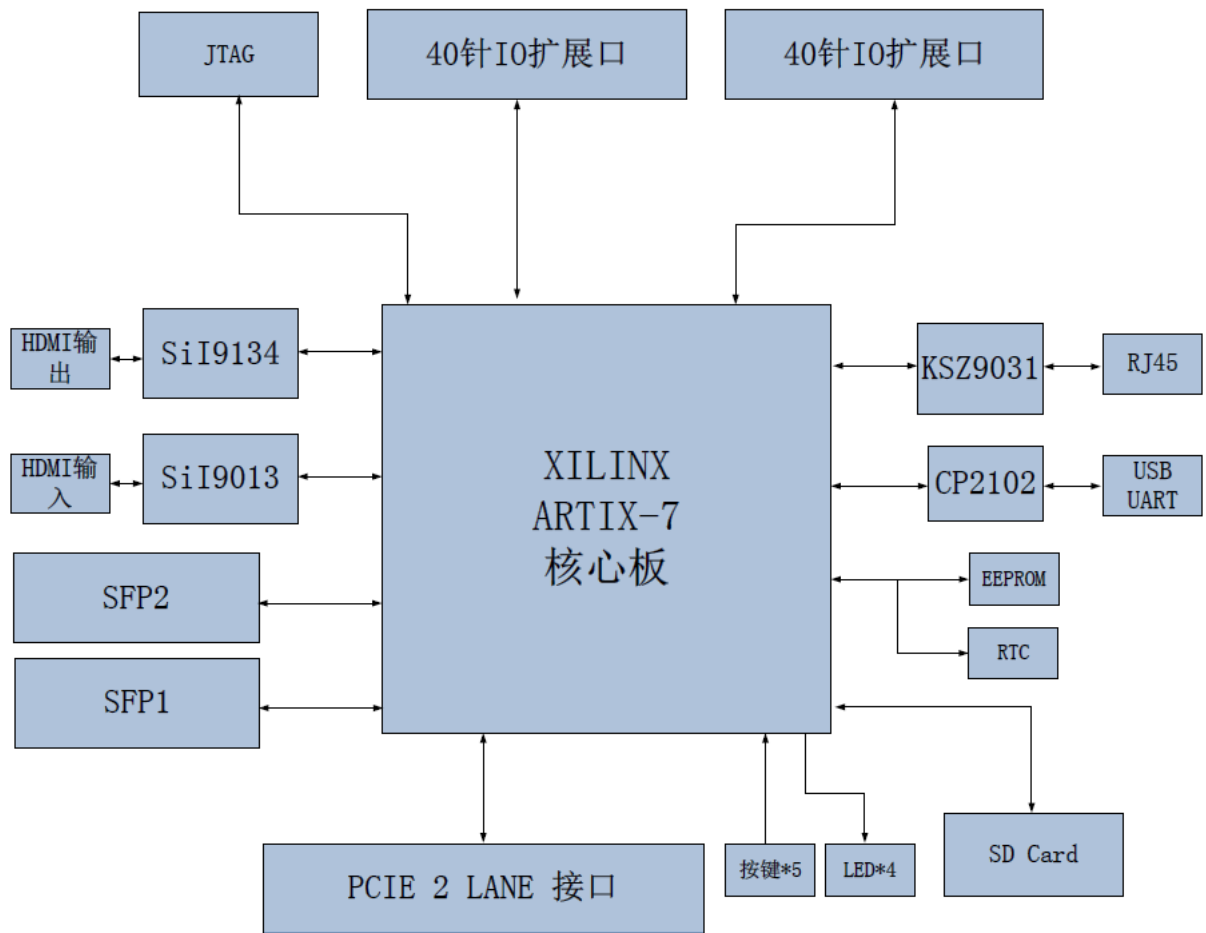

Figure 1-1-1: The Schematic Diagram of the AX7A035

Through this diagram, you can see the interfaces and functions that the AX7A035 FPGA Development Board contains:

➤ Artix-7 FPGA core board

The core board consists of XC7A35T + 8Gb DDR3 + 128Mb QSPI FLASH. There are two high-precision Sitime LVDS differential crystals, one at 200MHz and the other at 125MHz, providing stable clock input for FPGA systems and GTP modules.

➤ 1-channel PCIe x2 interface

Supports PCI Express 2.0 standard, provides PCIe x 2 high-speed data transmission interface, single channel communication rate up to 5Gbaud

➤ 2-channel high-speed SFP Interface

The two high-speed transceivers of the GTP transceiver of ARTIX-7 FPGA are connected to the transmission and reception of two optical modules to realize four high-speed optical fiber communication interfaces. Each fiber optic data communication receives and transmits at speeds up to 6.6 Gb/s.

➤ 1-channel Gigabit Ethernet Interface RJ-45 interface

The Gigabit Ethernet interface chip uses Micrel's KSZ9031RNX Ethernet PHY chip to provide network communication services to users. The KSZ9031RNX chip supports 10/100/1000 Mbps network transmission rates; full duplex and adaptive.

➤ 1-channel HDMI Output interface

Silion Image's SIL9134 HDMI encoding chip is selected to support up to 1080P@60Hz output and support 3D output.

➤ 1-channel HDMI Input interface

Silion Image's SIL9011/ SIL9013 HDMI decoder chip is selected, which supports up to 1080P@60Hz input and supports data output in different formats.

➤ 1-channel USB-to-Uart interface

1-channel USB-to-Uart interface for communication with the computer for user debugging. The serial port chip is the USB-UAR chip of Silicon Labs CP2102GM, and the USB interface is the MINI USB interface.

➤ Micro SD card holder

1-port Micro SD card slot, support SD mode and SPI mode

➤ EEPROM

Onboard an IIC interface EEPROM 24LC04

➤ 2-way 40-pin expansion port

Reserve 2-way 40-pin 0.1inch pitch expansion port can be connected to various ALINX modules (binocular camera, TFT LCD screen,

high-speed AD module, etc.). The expansion port contains 1 channel 5V power supply, 2 channel 3.3V power supply, 3 way ground, 34 IOs port.

➤ JTAG Interface

A 10-pin 0.1 inch spacing standard JTAG ports for FPGA program download and debugging.

➤ key

4 keys; 1 reset key (on the core board)

➤ LED Light

5 user LEDs (1 on the core board and 4 on the carrier board)

## **Part 2: AC7A035 Core Board**

### **Part 2.1: AC7A035 Core Board Introduction**

AC7A035 (core board model, the same below) FPGA core board, it is based on XILINX's ARTIX-7 series 100T XC7A35T-2FGG484I. It is a high-performance core board with high speed, high bandwidth and high capacity. It is suitable for high-speed data communication, video image processing, high-speed data acquisition etc.

This AC7A035 core board uses two pieces of MICRON's MT41J256M16HA-125 DDR3 chip, each DDR has a capacity of 4Gbit; two DDR chips are combined into a 32-bit data bus width, and the read/write data bandwidth between FPGA and DDR3 is up to 25Gb; such a configuration can meet the needs of high bandwidth data processing.

The AC7A035 core board expands 146 standard IO ports of 3.3V level, 15 standard IO ports of 1.5V level, and 4 pairs of GTP high speed RX/TX differential signals. For users who need a lot of IO, this core board will be a good choice. Moreover, the routing between the FPGA chip and the interface is equal length and differential processing, and the core board size is only 2.36 inch \*2.36 inch, which is very suitable for secondary development.

Figure 2-1-1: AC7A035 Core Board (Front View)

Figure 2-1-2: AC7A035 Core Board (Rear View)

## Part 2.2: FPGA Chip

As mentioned above, the FPGA model we use is XC7A35T-2FGG484I, which belongs to Xilinx's Artix-7 series. The speed grade is 2, and the temperature grade is industry grade. This model is a FGG484 package with 484 pins. Xilinx ARTIX-7 FPGA chip naming rules as below

Figure 2-2-1: The Specific Chip Model Definition of ARTIX-7 Series

Figure 2-2-2: FPGA chip on board

The main parameters of the FPGA chip XC7A35T are as follows

Name	Specific parameters
Logic Cells	33,280
Slices	5,200
CLB flip-flops	41,600
Block RAM (kb)	1,800

DSP Slices	90
PCIe Gen2	1
XADC	1 XADC, 12bit, 1Mbps AD
GTP Transceiver	4 GTP, 6.6Gb/s max
Speed Grade	-2
Temperature Grade	Industrial

## FPGA power supply system

Artix-7 FPGA power supplies are  $V_{CCINT}$ ,  $V_{CCBRAM}$ ,  $V_{CCAUX}$ ,  $V_{CCO}$ ,  $V_{MGTAVCC}$  and  $V_{MGTAVTT}$ .  $V_{CCINT}$  is the FPGA core power supply pin, which needs to be connected to 1.0V;  $V_{CCBRAM}$  is the power supply pin of FPGA Block RAM, connect to 1.0V;  $V_{CCAUX}$  is FPGA auxiliary power supply pin, connect 1.8V;  $V_{CCO}$  is the voltage of each BANK of FPGA, including BANK0, BANK13~16, BANK34~35. On AC7A035 FPGA core board, BANK34 and BANK35 need to be connected to DDR3, the voltage connection of BANK is 1.5V, and the voltage of other BANK is 3.3V. The  $V_{CCO}$  of BANK15 and BANK16 is powered by the LDO, and can be changed by replacing the LDO chip.  $V_{MGTAVCC}$  is the supply voltage of the FPGA internal GTP transceiver, connected to 1.0V;  $V_{MGTAVTT}$  is the termination voltage of the GTP transceiver, connected to 1.2V.

The Artix-7 FPGA system requires that the power-up sequence be power by  $V_{CCINT}$ , then  $V_{CCBRAM}$ , then  $V_{CCAUX}$ , and finally  $V_{CCO}$ . If  $V_{CCINT}$  and  $V_{CCBRAM}$  have the same voltage, they can be powered up at the same time. The order of power outages is reversed. The power-up sequence of the GTP transceiver is  $V_{CCINT}$ , then  $V_{MGTAVCC}$ , then  $V_{MGTAVTT}$ . If  $V_{CCINT}$  and  $V_{MGTAVCC}$  have the same voltage, they can be powered up at the same time. The power-off sequence is just the opposite of the power-on sequence.

## Part 2.3: Active Differential Crystal

The AC7A035 core board is equipped with two Sitime active differential crystals, one is 200MHz, the model is SiT9102-200.00MHz, the system main clock for FPGA and used to generate DDR3 control clock; the other is 125MHz,

model is SiT9102 -125MHz, reference clock input for GTP transceivers.

### Part 2.3.1: 200Mhz Active Differential clock

G1 in Figure 2-3-1 is the 200M active differential crystal that provides the development board system clock source. The crystal output is connected to the BANK34 global clock pin MRCC (R4 and T4) of the FPGA. This 200Mhz differential clock can be used to drive the user logic in the FPGA. Users can configure the PLLs and DCMs inside the FPGA to generate clocks of different frequencies.

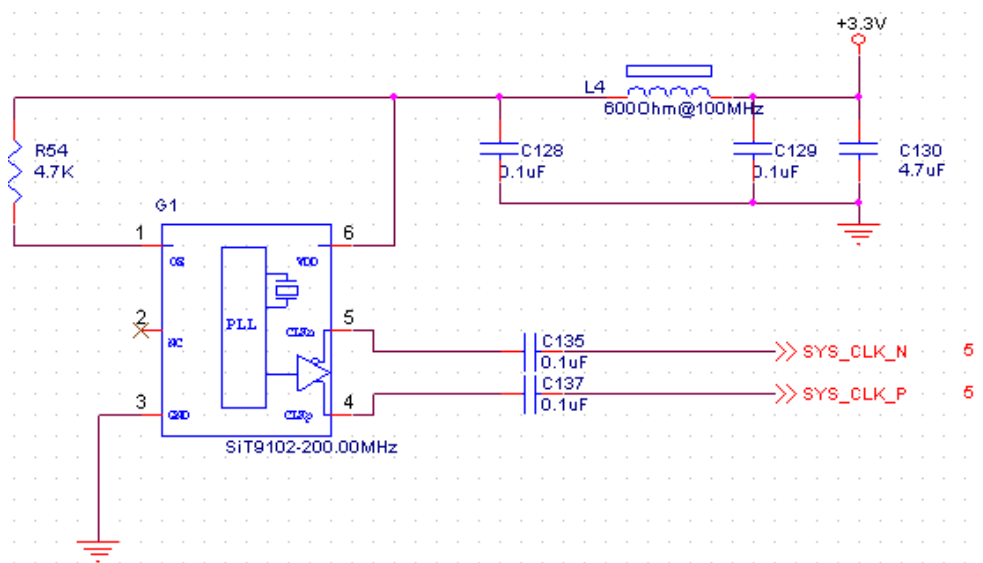

Figure 2-3-1: 200Mhz Active Differential Crystal Schematic

Figure 2-3-2: 200Mhz Active Differential Crystal on the Core Board

### 200Mhz Differential Clock Pin Assignment

Signal Name	FPGA PIN
SYS_CLK_P	R4
SYS_CLK_N	T4

### Part 2.3.2: 125MHz Active Differential Crystal

G2 in Figure 2-3-3 is the 125MHz active differential crystal, which is the reference input clock provided to the GTP module inside the FPGA. The crystal output is connected to the GTP BANK216 clock pins MGTREFCLK0P (F6) and MGTREFCLK0N (E6) of the FPGA.

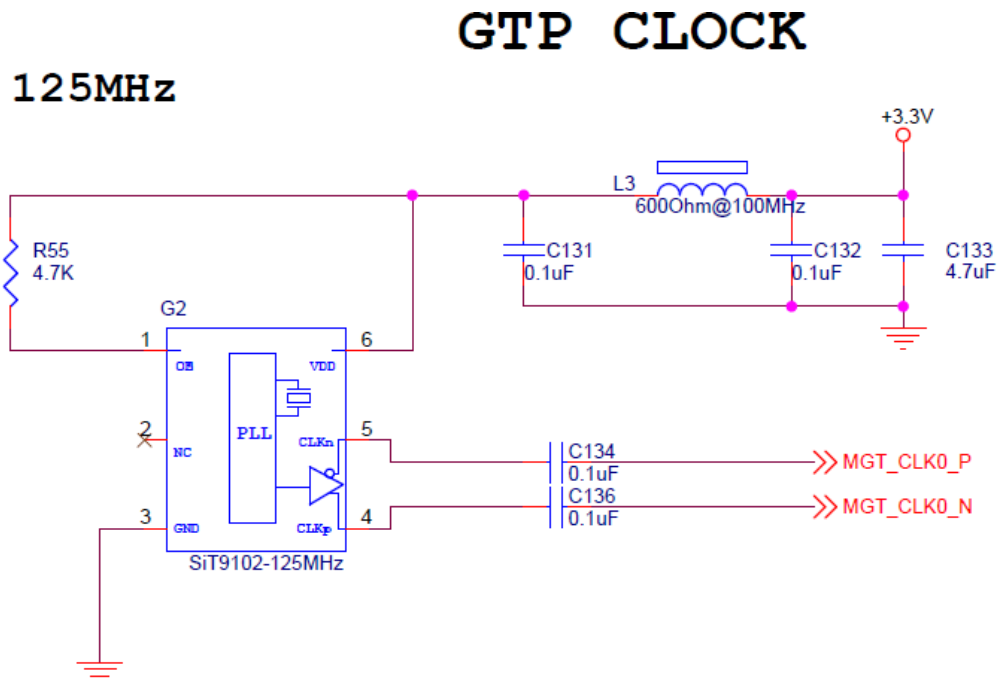

Figure 2-3-3: 125MHz Active Differential Crystal Schematic

### 125MHz Differential Clock Pin Assignment

Net Name	FPGA PIN
MGT_CLK0_P	F6
MGT_CLK0_N	E6

## Part 2.4: DDR3 DRAM

The FPGA core board AC7A035 is equipped with two Micron 4Gbit (512MB) DDR3 chips (8Gbit in totally), model is MT41J256M16HA-125 (compatible with MT41K256M16HA-125). The DDR3 SDRAM has a maximum operating speed of 400MHz (data rate 800Mbps). The DDR3 memory system is directly connected to the memory interface of the BANK 34 and BANK35 of the FPGA. The specific configuration of DDR3 SDRAM is shown in Table 2-4-1.

Bit Number	Chip Model	Capacity	Factory
U5,U6	MT41J256M16HA-125	256M x 16bit	Micron

Table 2-4-1: DDR3 SDRAM Configuration

The hardware design of DDR3 requires strict consideration of signal integrity. We have fully considered the matching resistor/terminal resistance, trace impedance control, and trace length control in circuit design and PCB design to ensure high-speed and stable operation of DDR3. Figure 2-4-1 details the hardware connection of DDR3 DRAM

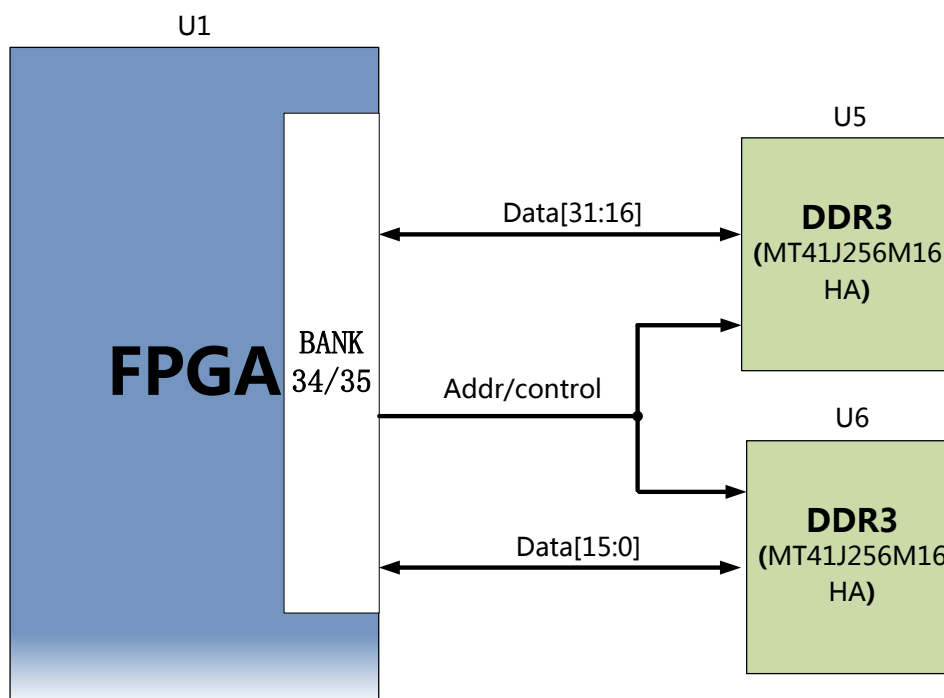

Figure 2-4-1: The DDR3 DRAM Schematic

Figure 2-4-2: The DDR3 on the Core Board

### DDR3 DRAM pin assignment:

Net Name	FPGA PIN Name	FPGA P/N
DDR3_DQS0_P	IO_L3P_T0_DQS_AD5P_35	E1

## Part 2.5: QSPI Flash

The FPGA core board AC7A035 is equipped with one 128Mbit QSPI FLASH, and the model is N25Q128, which uses the 3.3V CMOS voltage standard. Due to the non-volatile nature of QSPI FLASH, it can be used as a boot device for the system to store the boot image of the system. These images mainly include FPGA bit files, ARM application code, soft core application code and other user data files. The specific models and related parameters of SPI FLASH are shown in Table 2-5-1.

Position	Model	Capacity	Factory
U8	N25Q128	128M Bit	Numonyx

Table 2-5-1: QSPI FLASH Specification

QSPI FLASH is connected to the dedicated pins of BANK0 and BANK14 of the FPGA chip. The clock pin is connected to CCLK0 of BANK0, and other data and chip select signals are connected to D00~D03 and FCS pins of BANK14 respectively. Figure 2-5-1 shows the hardware connection of QSPI Flash.

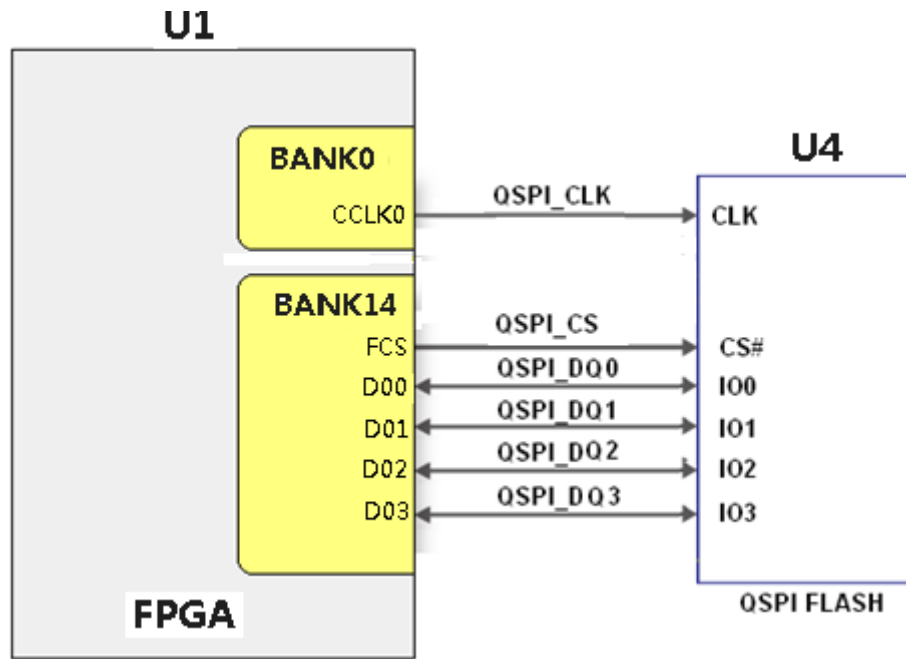

Figure 2-5-1: QSPI Flash Schematic

#### QSPI Flash pin assignments:

Net Name	FPGA PIN Name	FPGA P/N
QSPI_CLK	CCLK_0	L12
QSPI_CS	IO_L6P_T0_FCS_B_14	T19
QSPI_DQ0	IO_L1P_T0_D00_MOSI_14	P22
QSPI_DQ1	IO_L1N_T0_D01_DIN_14	R22
QSPI_DQ2	IO_L2P_T0_D02_14	P21
QSPI_DQ3	IO_L2N_T0_D03_14	R21

Figure 2-5-1: QSPI FLASH on the Core Board

## Part 2.6: LED Light on Core Board

There are 3 red LED lights on the AC7A035 FPGA core board, one of which is the power indicator light (PWR), one is the configuration LED light (DONE), and one is the user LED light. When the core board is powered, the power indicator will illuminate; when the FPGA is configured, the configuration LED will illuminate. The user LED light is connected to the IO of the BANK34, the user can control the light on and off by the program. When the IO voltage connected to the user LED is high, the user LED is illuminate. When the connection IO voltage is low, the user LED will be extinguished. The schematic diagram of the LED light hardware connection is shown in Figure 2-6-1:

Figure 2-6-1: LED lights on the Core Board Schematic

Figure 2-6-2: LED lights on the Core Board

### User LEDs Pin Assignment

Signal Name	FPGA Pin Name	FPGA Pin Number	Description
LED1	IO_L15N_T2_DQS_34	W5	User LED

## Part 2.7: JTAG Interface

The JTAG test socket J1 is reserved on the AC7A035 core board for JTAG download and debugging when the core board is used alone. Figure 2-7-1 is the schematic part of the JTAG port, which involves TMS, TDI, TDO, TCK. ,

GND, +3.3V these six signals.

Figure 2-7-1: JTAG Interface Schematic

The JTAG interface J1 on AC7A035 FPGA core board uses a 6-pin 2.54mm pitch single-row test hole. If you need to use the JTAG connector to debug on the core board, you need to solder a 6-pin single-row pin header. Figure 2-7-2 shows the JTAG interface J1 on the AC7A200 FPGA core board.

Figure 2-7-2 JTAG Interface on Core Board

## Part 2.8: Power Interface on the Core Board

In order to make the AC7A035 FPGA core board work alone, the core board is reserved 2-pin power supply interface J2. If the user wants to debug the function of the core board separately (without the carrier board), the external device needs to provide +5V to supply power to the core board.

Figure 2-8-1: Power Interface schematic on the Core Board

Figure 2-8-2: Power interface on the Core Board

## Part 2.9: Board to Board Connectors pin assignment

The core board has a total of four high-speed board to board connectors. The core board uses four 80-pin inter-board connectors to connect to the carrier board. The connector uses Panasonic AXK580137YG in the core board, and the connector model corresponding to the carrier board is AXK680337YG. The IO port of the FPGA is connected to the four connectors by differential routing. The pin spacing of the connectors is 0.5mm, insert to the board to board connectors on the carrier board for high-speed data communication.

### Board to Board Connectors CON1

The 80-pin board to board connectors CON1, which are used to connect with the VCCIN power supply (+5V) and ground on the carrier board, extend the normal IOs of the FPGA. It should be noted here that 15 pins of CON1 are connected to the IO port of BANK34, because the BANK34 connection is connected to DDR3. Therefore, the voltage standard of all IOs of this BANK34 is 1.5V. The IOs of BANK 13 is not existed in XC7A35T chipset, it is designed to compatible with XC7A100T/XC7A200T chipset, please do not use these IO in AC7A035 board.

### Pin Assignment of Board to Board Connectors CON1

CON1 PIN	Net Name	FPGA PIN	Voltage Level	CON1 PIN	Net Name	FPGA PIN	Voltage Level

## Board to Board Connectors CON2

The 80-pin female connection header CON2 is used to extend the normal IO of the BANK13 and BANK14 of the FPGA. The voltage standards of both BANK are 3.3V. **The IOs of BANK 13 is not existed in XC7A35T chipset, it is designed to compatible with XC7A100T/XC7A200T chipset, please do not use these IO in AC7A035 board.**

### Board to Board Connectors CON3

The 80-pin connector CON3 is used to extend the normal IO of the BANK15 and BANK16 of the FPGA. In addition, four JTAG signals are also connected to the carrier board via the CON3 connector. The voltage standards of BANK15 and BANK16 can be adjusted by an LDO chip. The default installed LDO is 3.3V. If you want to output other standard levels, you can replace it with a suitable LDO.

## Board to Board Connectors CON4

The 80-Pin connector CON4 is used to extend the normal IO and GTP high-speed data and clock signals of the FPGA BANK16. The voltage standard of the IO port of BANK16 can be adjusted by an LDO chip. The default installed LDO is 3.3V. If the user wants to output other standard levels, it can be replaced by a suitable LDO. The high-speed data and clock signals of the GTP are strictly differential routed on the core board. The data lines are equal in length and kept at a certain interval to prevent signal interference.

The Pin1 of the connector has been marked with a dot on the board.

Figure 2-9-4: Board to Board Connectors CON4 on the Core Board

## Part 2.10: Power Supply

The AC7A035 FPGA core board is powered by DC5V via carrier board, and it is powered by the Mini USB interface J2 when it is used alone. Please be careful not to supply power by the Mini USB J2 and the carrier board at the

same time to avoid damage. The power supply design diagram on the board is shown in Figure 2-10-1.

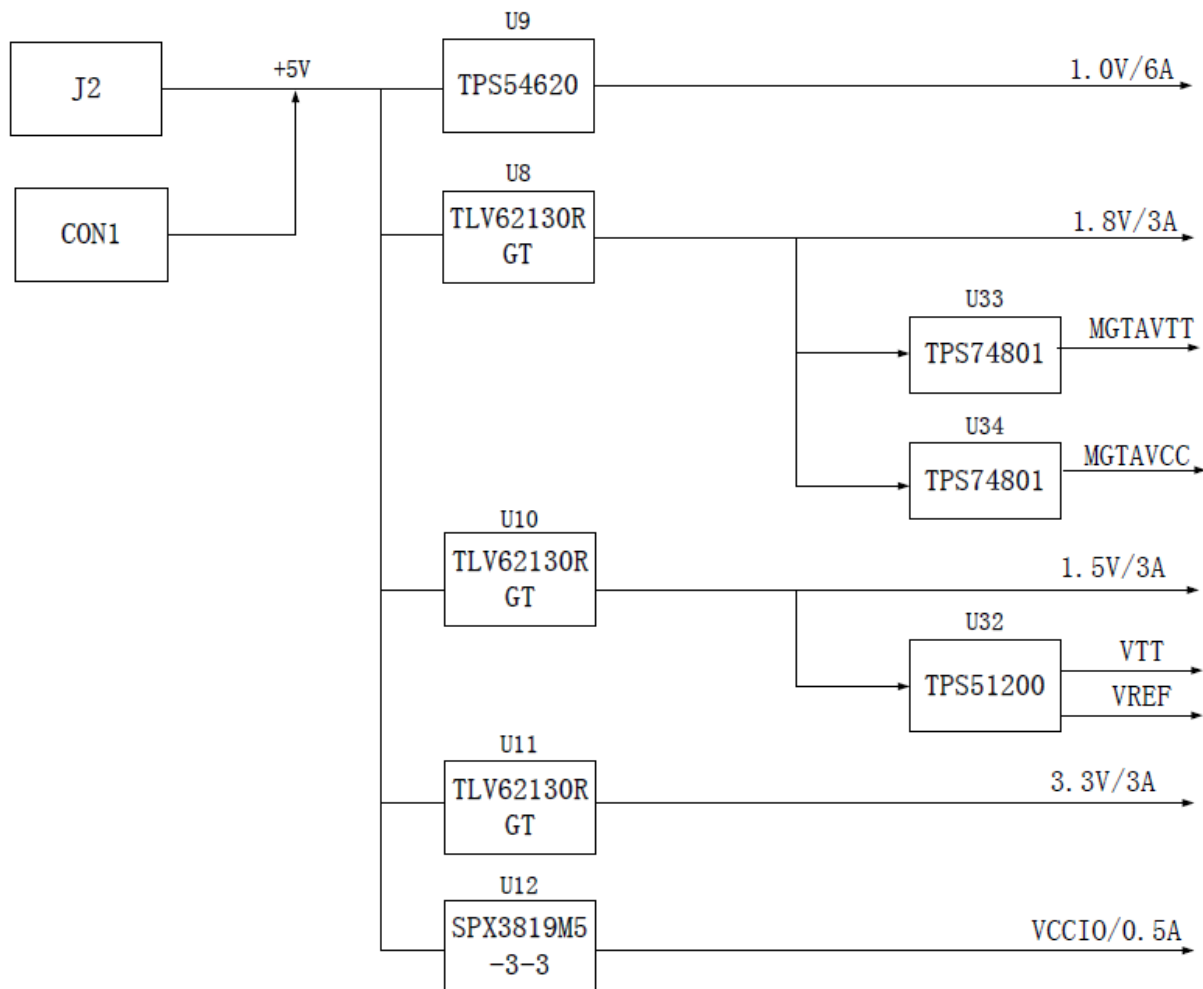

Figure 2-10-1: Power Supply on core board schematic

The core board is powered by +5V and converted to +3.3V, +1.5V, +1.8V, +1.0V four-way power supply through three DC/DC power supply chip TLV62130RGT. The current of +1.0V can be up to 6A, and the other three output currents can be up to 3A. The VCCIO is generated by one LDOSPX3819M5-3-3. VCCIO mainly supplies power to BANK15 and BANK16 of FPGA. Users can change the IO of BANK15,16 to different voltage standards by replacing their LDO chip. The 1.5V generates the VTT and VREF voltages required by DDR3 via TI's TPS51200. The 1.8V power supply of MGTAVTT and MGTAVCC for the GTP transceiver is generated by TI's

TPS74801 chip. The functions of each power distribution are shown in the following table:

Power Supply	Function
+1.0V	FPGA Core Voltage
+1.8V	FPGA auxiliary voltage, TPS74801 power supply
+3.3V	VCCIO of Bank0,Bank13 and Bank14 of FPGA,QSIP FLASH, Clock Crystal
+1.5V	DDR3, Bank34 and Bank35 of FPGA
VREF,VTT(+0.75V)	DDR3
CCIP(+3.3V)	FPGA Bank15, Bank16
MGTAVTT(+1.2V)	GTP Transceiver Bank216 of FPGA
MGTVCC(+1.0V)	GTP Transceiver Bank216 of FPGA

Because the power supply of Artix-7 FPGA has the power-on sequence requirement, in the circuit design, we have designed according to the power requirements of the chip, and the power-on is 1.0V->1.8V->(1.5 V, 3.3V, VCCIO) and 1.0V-> MGTVCC -> MGTAVTT, the circuit design to ensure the normal operation of the chip.

The power circuit on the AC7A035 FPGA core board is shown in Figure 2-10-2:

Figure 2-10-2: Power Supply on the AC7A200 FPGA Core Board

## Part 2.11: Size Dimension

Figure 2-11-1: AC7A035 FPGA Core board (Top view)

Figure 2-11-2: AC7A035 FPGA Core board (Bottom view)

## Part 3: Carrier Board

### Part 3.1: Carrier Board Introduction

Through the previous function introduction, you can understand the function of the carrier board part

- 1-channel PCIe x2 high speed data transmission interface
- 2-Port SPF cage
- 1-channel HDMI video input interface
- 1-channel HDMI video output interface
- 1-channel 10/100M/1000M Ethernet RJ-45 interface
- 1-channel USB-to-Uart Bridge Communication interface
- 1 SD Card Slot
- EEPROM
- 2-channel 40-pin expansion ports
- JTAG debugging interface
- 5 independent keys
- 4 user LED lights

## Part 3.2: Gigabit Ethernet Interface

The AX7A035 FPGA development board provides users with 1-channel Gigabit network communication service through the Micrel KSZ9031RNX Ethernet PHY chip. The Ethernet PHY chip is connected to the IO interface of the ARTIX7 FPGA. The KSZ9031RNX chip supports 10/100/1000 Mbps network transmission rate and communicates with the FPGA through the RGMII interface. KSZ9031RNX supports MDI/MDX adaptation, various speed adaptations, Master/Slave adaptation, and support for MDIO bus for PHY register management.

The KSZ9031RNX will detect the level status of some specific IOs to determine their working mode after powered on. Table 3-1-1 describes the default setup information after the GPHY chip is powered on.

Configuration Pin	Instructions	Configuration value
PHYAD[2:0]	MDIO/MDC Mode PHY Address	PHY Address 011
CLK125_EN	Enable 125Mhz clock output selection	Enable
LED_MODE	LED light mode configuration	Single LED light mode
MODE0~MODE3	Link adaptation and full duplex configuration	10/100/1000 adaptive, compatible Full-duplex, half-duplex

Table 3-2-1: PHY chip default configuration value

When the network is connected to Gigabit Ethernet, the data transmission of FPGA and PHY chip KSZ9031RNX is communicated through the RGMII bus, the transmission clock is 125Mhz, and the data is sampled on the rising and falling edge of the clock.

When the network is connected to 100M Ethernet, the data transmission of FPGA and PHY chip KSZ9031RNX is communicated through the RMII bus, the transmission clock is 25Mhz, and the data is sampled on the rising and falling edge of the clock.

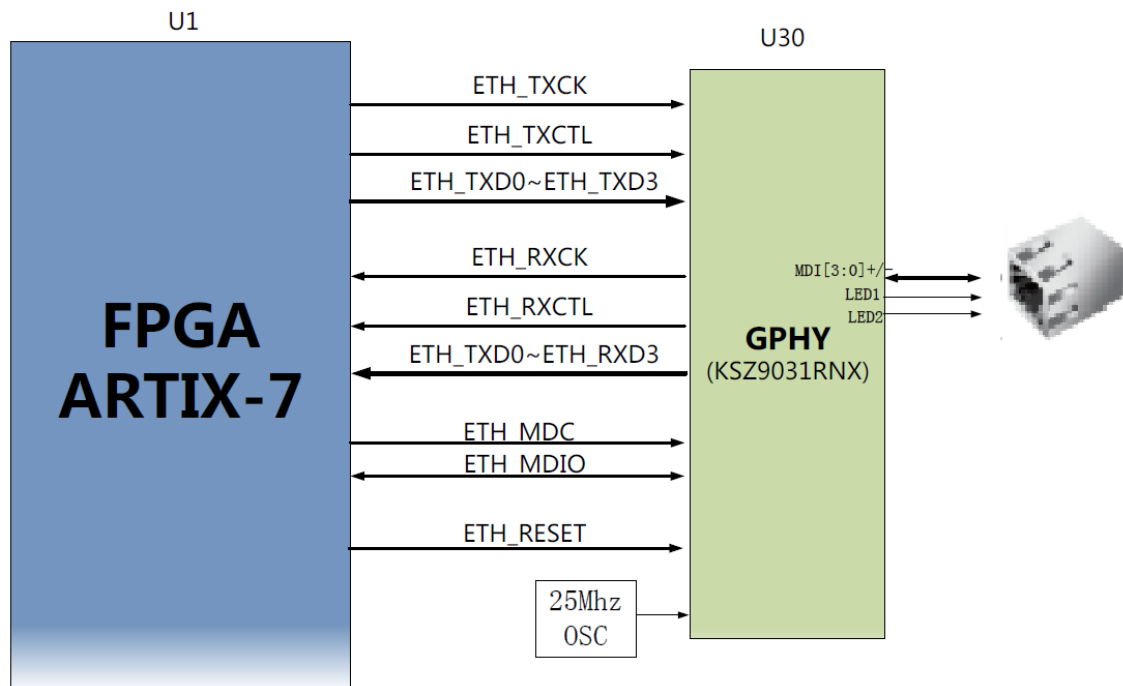

Figure 3-2-1: Gigabit Ethernet Interface Schematic

Figure 3-3-2: Gigabit Ethernet interface on the Carrier board

**Gigabit Ethernet Chip PHY pin assignments are as follows:**

Signal Name	FPGA Pin Number	Description
ETH_TXCK	P15	RGMII transmit clock
ETH_TXD0	N14	Transmit Data bit0
ETH_TXD1	P16	Transmit Data bit1
ETH_TXD2	R17	Transmit Data bit2
ETH_TXD3	R16	Transmit Data bit3
ETH_TXCTL	N17	Transmit Enable Signal
ETH_RXCK	V18	RGMII Receive Clock
ETH_RXD0	P19	Receive Data Bit0

ETH_RXD1	U18	Receive Data Bit1
ETH_RXD2	U17	Receive Data Bit2
ETH_RXD3	P17	Receive Data Bit3
ETH_RXCTL	R19	Receive data valid signal
ETH_MDC	N13	MDIO Management Clock
ETH_MDIO	P14	MDIO Management Data
ETH_RESET	R14	PHY Chip Reset Signal

## Part 3.3: SFP Interface

The AX7A035 FPGA development board has two optical interfaces. Users can purchase SFP optical modules (1.25G, 2.5G optical modules on the market) and insert them into these two optical interfaces for optical data communication. The two fiber interfaces are connected to the two RX/TX of the GNK transceiver of the FPGA. The TX signal and the RX signal are connected to the FPGA and the optical module through the DC blocking capacitor in differential signal mode. The TX and RX data rates are up to each 6.6Gb/s per channel. The reference clock for the GTX transceiver is provided by the 125Mhz differential clock of AC7A035 FPGA core board.

Figure 3-3-1 detailed the schematic diagram of FPGA and fiber design

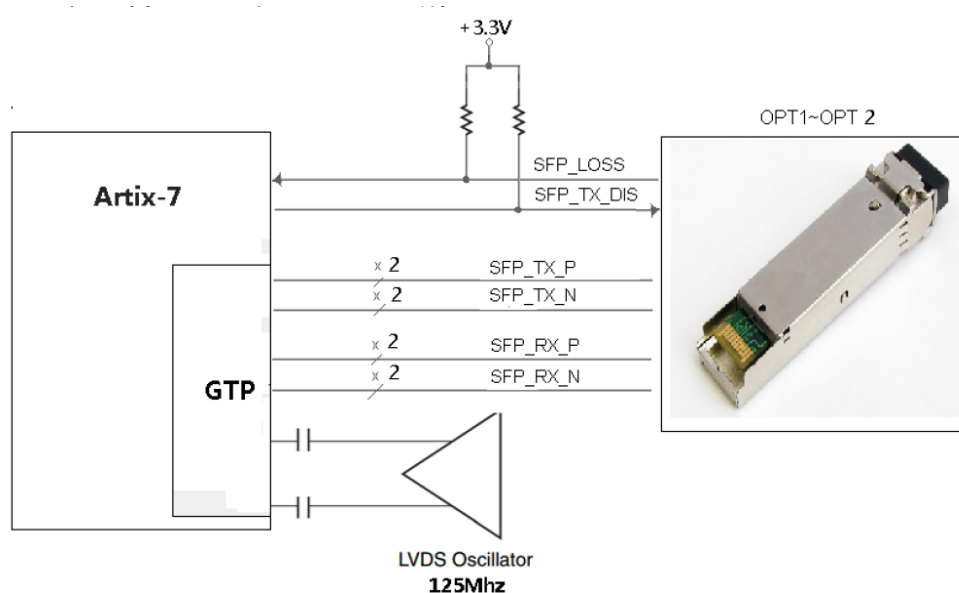

Figure 3-3-1: SFP Interface Schematic

Figure 3-3-2: SFP interfaces on the Carrier Board

**The 1<sup>st</sup> fiber interface FPGA pin assignment is as follows:**

Signal Name	FPGA PIN	Description
SFP1_TX_P	B4	SFP1 Data Transfer (Positive)
SFP1_TX_N	A4	SFP1 Data Transfer (Negative)
SFP1_RX_P	B8	SFP1 Data Receiver (Positive)
SFP1_RX_N	A8	SFP1 Data Receiver (Negative)
SFP1_TX_DIS	J15	SFP1 Optical Transfer Disable, active high
SFP1_LOSS	H15	SFP1 Optical LOSS, High level means no light signal is received

**The 2<sup>nd</sup> fiber interface FPGA pin assignment is as follows:**

Signal Name	FPGA PIN	Description
SFP2_TX_P	D5	SFP2 Data Transfer (Positive)
SFP2_TX_N	C5	SFP2 Data Transfer (Negative)
SFP2_RX_P	D11	SFP2 Data Receiver (Positive)
SFP2_RX_N	C11	SFP2 Data Receiver (Negative)
SFP2_TX_DIS	H14	SFP2 Optical Transfer Disable, active high
SFP2_LOSS	J14	SFP2 Optical LOSS, High level means no light signal is received

## Part 3.4: PCIe x2 Interface

The AX7A035 FPGA development board provides an industrial-grade high-speed data transfer PCIe x2 interface. The PCIE card interface conforms to the standard PCIe card electrical specifications and can be used directly on the x2 PCIe slot of a normal PC.

The transmit and receive signals of the PCIe interface are directly connected to the GTP transceiver of the FPGA. The four channels of TX and RX signals are connected to the FPGA in differential signals, and the single channel communication rate can be up to 5G bit bandwidth. The PCIe reference clock is provided to the AX7A035 FPGA development board by the PCIe slot of the PC with a reference clock frequency of 100Mhz.

The design diagram of the PCIe interface of the AX7A035 FPGA development board is shown in Figure 3-4-1, where the TX transmit signal and the reference clock CLK signal are connected in AC coupled mode.

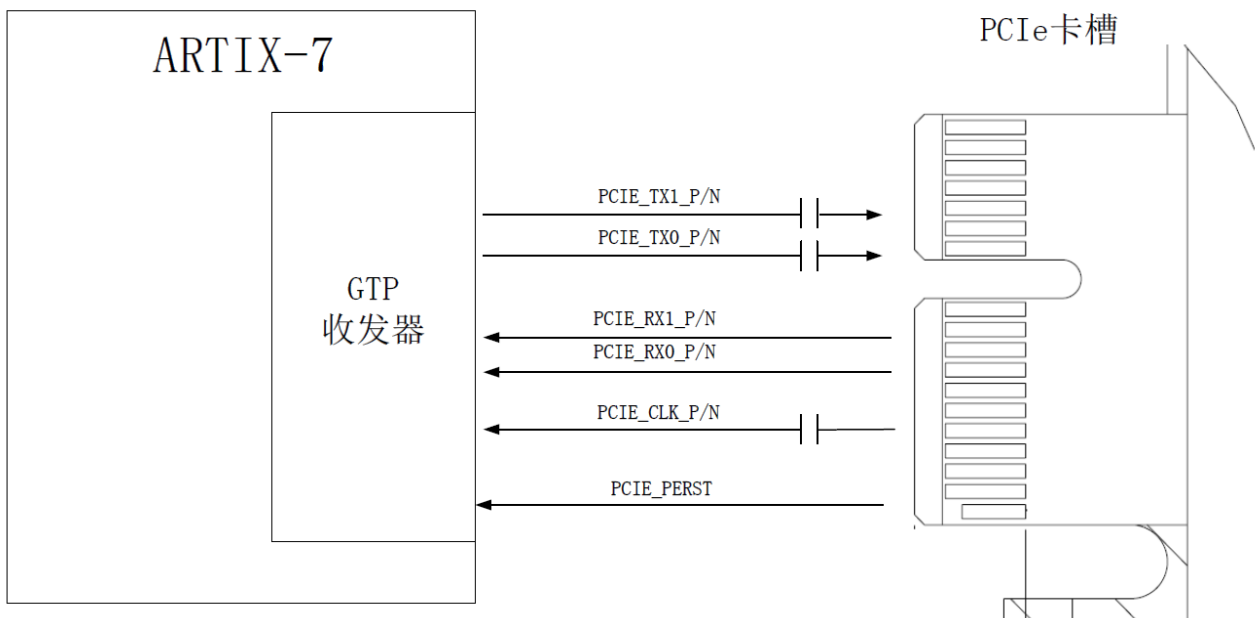

Figure 3-4-1: PCIe x2 schematic

Figure 3-4-2: PClex2 on the Carrier Board

**PClex2 Interface Pin Assignment:**

Signal Name	FPGA Pin	Description
PCIE_RX0_P	D9	PCIE Channel 0 Data Receive Positive
PCIE_RX0_N	C9	PCIE Channel 0 Data Receive Negative
PCIE_RX1_P	B10	PCIE Channel 1 Data Receive Positive
PCIE_RX1_N	A10	PCIE Channel 1 Data Receive Negative

**Part 3.5: HDMI output interface**

HDMI output interface, select Silion Image's SIL9134 HDMI (DVI) encoding chip, support up to 1080P@60Hz output, support 3D output.

The IIC configuration interface of SIL9134 is also connected to the IO of the FPGA. The SIL9134 is initialized and controlled by FPGA programming. The hardware connection of the HDMI output interface is shown in Figure 3-5-1.

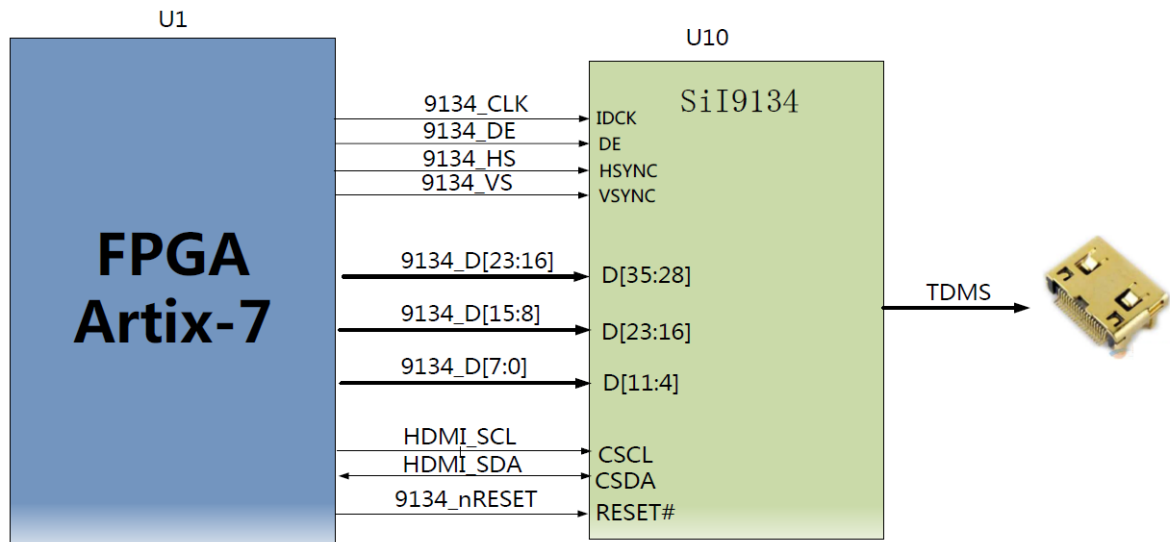

Figure 3-5-1: HDMI Output Schematic

Figure 3-5-1: HDMI Output on the Carrre Board

### HDMI Input Pin Assignment:

Signal Name	FPGA Pin
9134_NRESET	L18
9134_CLK	Y22
9134_HS	T18
9134_VS	R18
9134_DE	U22
9134_D[0]	V22
9134_D[1]	Y18
9134_D[2]	Y19
9134_D[3]	W19
9134_D[4]	W20

9134_D[5]	Y21
9134_D[6]	U21
9134_D[7]	T21
9134_D[8]	W21
9134_D[9]	W22
9134_D[10]	T20
9134_D[11]	AB18
9134_D[12]	AA18
9134_D[13]	AA19
9134_D[14]	AB20
9134_D[15]	AA20
9134_D[16]	AA21
9134_D[17]	AB22
9134_D[18]	AB21
9134_D[19]	W17
9134_D[20]	V17
9134_D[21]	V20
9134_D[22]	U20
9134_D[23]	V19
HDMI_SCL	H13
HDMI_SDA	G13

## Part 3.6: HDMI Input interface

HDMI output interface, select Sillion Image's SIL9013/9011 HDMI decoder chip, support up to 1080P@60Hz input and support data output in different formats.

The IIC configuration interface of the SIL9013/9011 is connected to the IO of the FPGA. The SIL9013 is initialized and controlled through FPGA programming. The hardware connection of the HDMI input interface is shown in Figure 3-6-1.

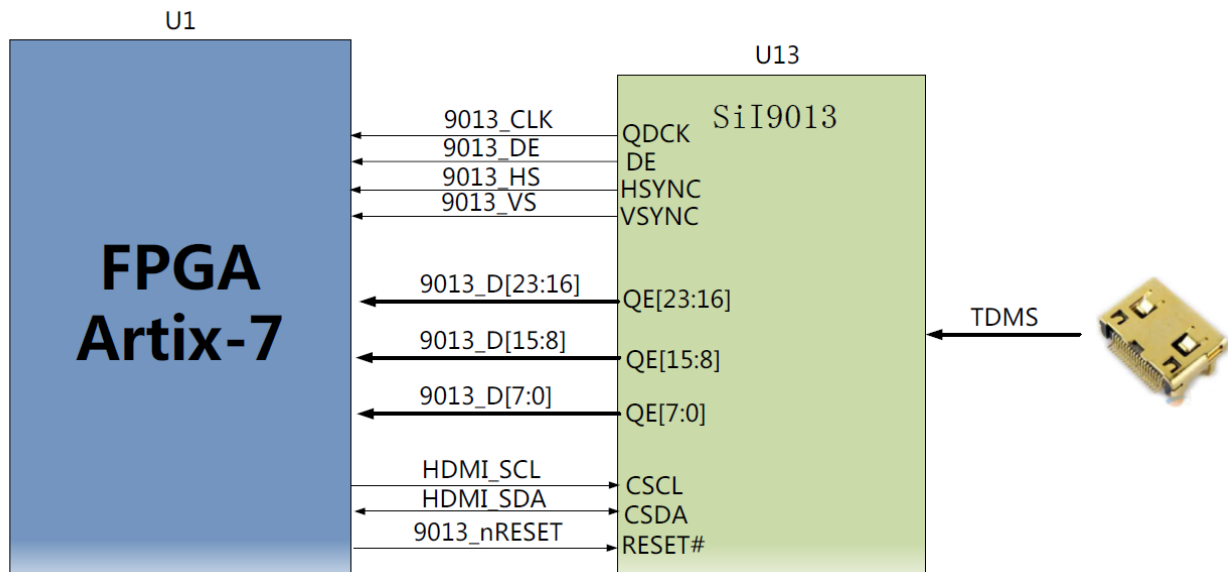

Figure 3-6-1: HDMI Input Schematic

Figure 3-6-2: HDMI Input on the Carrier Board

### HDMI Input Pin Assignment:

Signal Name	FPG Pin Number
9013_NRESET	J21
9013_CLK	K18
9013_HS	N18
9013_VS	M18
9013_DE	N19
9013_D[0]	M20
9013_D[1]	N20
9013_D[2]	L21
9013_D[3]	M21

9013_D[4]	K19
9013_D[5]	H17
9013_D[6]	H18
9013_D[7]	N22
9013_D[8]	M22
9013_D[9]	K22
9013_D[10]	K21
9013_D[11]	J22
9013_D[12]	H22
9013_D[13]	H20
9013_D[14]	G20
9013_D[15]	M17
9013_D[16]	J16
9013_D[17]	G17
9013_D[18]	G18
9013_D[19]	G15
9013_D[20]	G16
9013_D[21]	J19
9013_D[22]	H19
9013_D[23]	J20
HDMI_SCL	H13
HDMI_SDA	G13

## Part 3.7: SD Card Slot

The SD card (Secure Digital Memory Card) is a memory card based on the semiconductor flash memory process. It was completed in 1999 by the Japanese Panasonic-led concept, and the participants Toshiba and SanDisk of the United States conducted substantial research and development. In 2000, these companies launched the SD Association (Secure Digital Association), which has a strong lineup and attracted a large number of vendors. These

include IBM, Microsoft, Motorola, NEC, Samsung, and others. Driven by these leading manufacturers, SD cards have become the most widely used memory card in consumer digital devices.

The SD card is a very common storage device. The extended SD card supports SPI mode and SD mode. The SD card used is a MicroSD card. The schematic diagram is shown in Figure 3-7-1.

Figure 3-7-1: SD Card Schematic

### SD card slot pin assignment:

SD Mode	
Signal Name	FPGA PIN
SD_CLK	E13
SD_CMD	E14
SD_CD_N	C13
SD_DAT0	D15
SD_DAT1	D14
SD_DAT2	F14
SD_DAT3	F13

## Part 3.8: USB-to-Uart Bridge Connector

The AX7A035 FPGA development board includes the USB-UAR chip of Silicon Labs CP2102GM. The USB interface uses the MINI USB interface. It can be connected to the USB port of the upper PC for serial data communication with a USB cable. The schematic diagram of the USB Uart circuit design is shown in Figure 3-8-1:

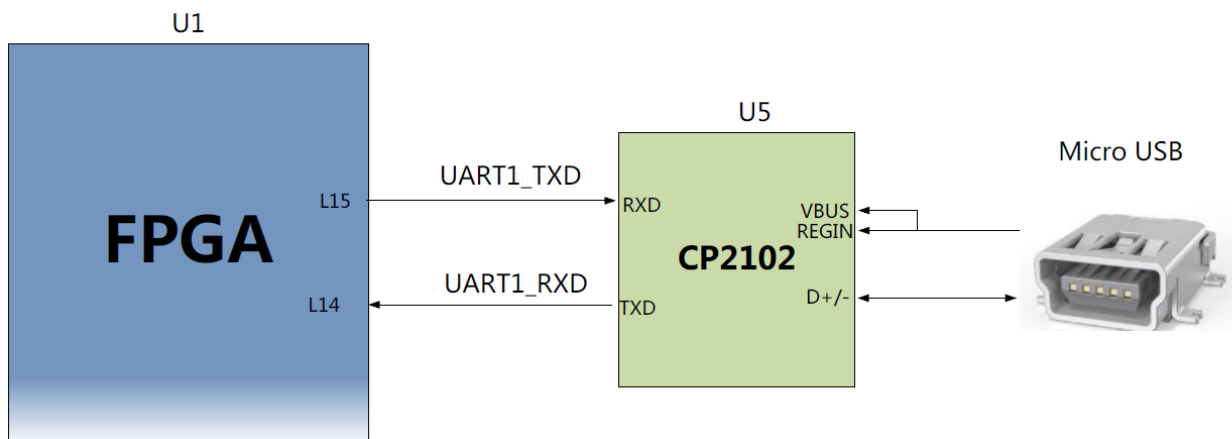

Figure 3-8-1: USB to serial port schematic

Figure 3-8-2: USB to serial port on the Carrier Board

Two LED indicators (LED3 and LED4) are set for the serial port signal, and the silkscreen on the PCB is TX and RX, indicating that the serial port has data transmission or reception, as shown in the following Figure 3-8-3

Figure 3-8-3: Serial Port communication LED Indicators Schematic

### USB-to-UART pin assignment:

Signal Name	FPGA PIN
UART1_RXD	L14
UART1_TXD	L15

## Part 3.9: EEPROM 24LC04

AX7A035 carrier board contains an EEPROM, model 24LC04, and has a capacity of 4Kbit (2\*256\*8bit). It consists of two 256-byte blocks and communicates via the IIC bus. The onboard EEPROM is to learn how to communicate with the IIC bus. The I2C signal of the EEPROM is connected to the BANK15 IO port on the FPGA side. Figure 3-9-1 below shows the design of the EEPROM

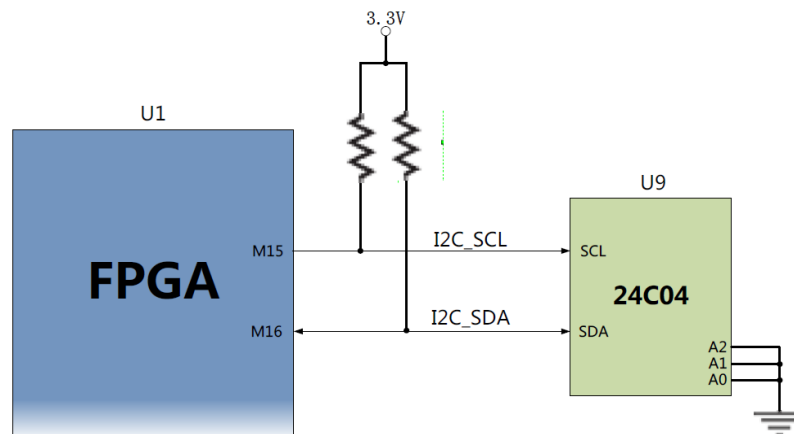

Figure 3-8-1: EEPROM Schematic

Figure 3-9-2: EEPROM on the Carrier Board

### EEPROM Pin Assignment

Net Name	FPGA PIN
I2C_SCL	M15
I2C_SDA	M16

## Part 3.10: Temperature Sensor

A high-precision, low-power, digital temperature sensor chip is mounted on the AX7A035 FPGA development board, and the model is LM75 of ON Semiconductor. The temperature accuracy of the LM75 chip is 0.5 degrees, I2C bus is shared with EEPROM. The sensor and FPGA are directly connected to the I2C digital interface. The FPGA reads the temperature near the current FPGA development board through the I2C interface. Figure 3-10-1 below shows the design of the LM75 sensor chip.

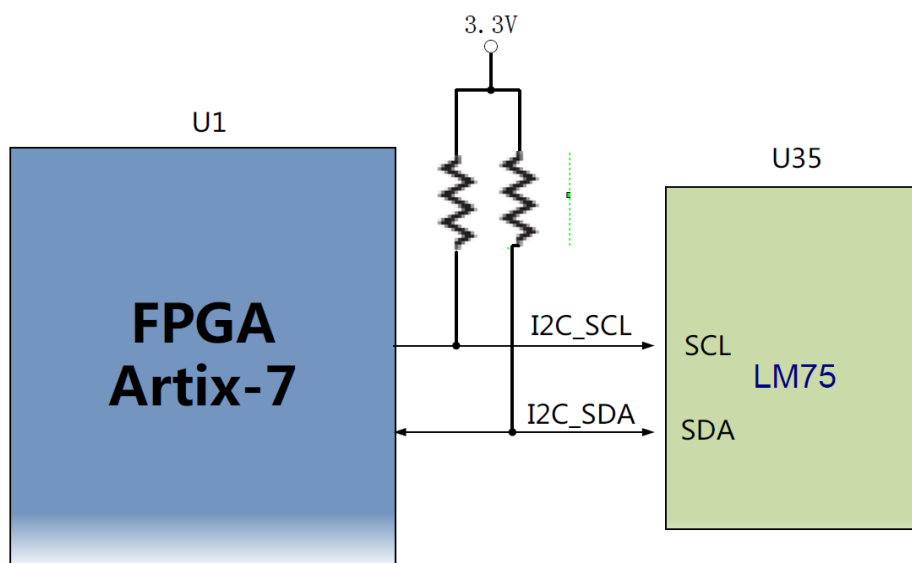

Figure 3-10-1: LM75 Sensor Schematic

Figure 3-10-2: LM75 Sensor on the FPGA Board

### LM75 Sensor Pin Assignment

Pin Name	FPGA Pin
I2C_SCL	M15
I2C_SDA	M16

## Part 3.11: Expansion Header

The carrier board is reserved with two 0.1inch spacing standard 40-pin expansion ports J11 and J13, **but J13 Can't be used because it connect the IOs of BANK13**. The expansion port has 40 signals, of which 1-channel 5V power supply, 2-channel 3.3 V power supply, 3-channle ground and 34 IOs. **Do not directly connect the IO directly to the 5V device to avoid burning the FPGA. If you want to connect 5V equipment, you need to connect level conversion chip.**

A 33 ohm resistor is connected in series between the expansion port and the FPGA connection to protect the FPGA from external voltage or current. The circuit of the expansion port (J11) is shown in Figure 3-11-1.

Figure 3-11-1: Expansion header J11 schematic

The figure 3-11-2 detailed the J11 expansion port on the carrier board. The Pin1 and Pin2 of the expansion port are already marked on the board.

Figure 3-11-2: Expansion header J11 on the Carrier Board

### J11 Expansion Header Pin Assignment

Pin Number	FPGA Pin	Pin Number	FPGA Pin
1	GND	2	+5V
3	G21	4	G22
5	C22	6	B22
7	F19	8	F20

9	D20	10	C20
11	A18	12	A19
13	B20	14	A20
15	F18	16	E18
17	E19	18	D19
19	C18	20	C19
21	B17	22	B18
23	D17	24	C17
25	A15	26	A16
27	B15	28	B16
29	A13	30	A14
31	E16	32	D16
33	C14	34	C15
35	F16	36	E17
37	GND	38	GND
39	+3.3V	40	+3.3V

## Part 3.12: JTAG Interface

The development board reserves a JTAG interface for downloading FPGA programs or firmware to FLASH. In order to prevent damage to the FPGA chip caused by hot plugging, we added a protection diode to the JTAG signal to ensure that the signal voltage is within the range accepted by the FPGA to avoid damage to the FPGA.

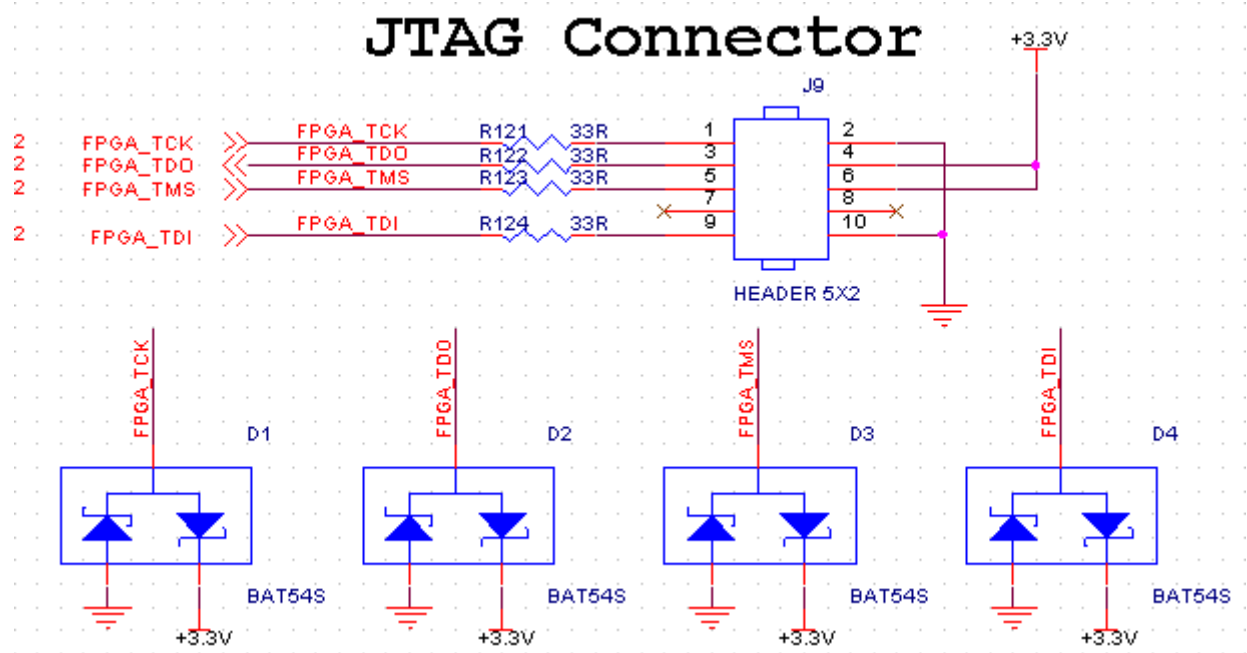

Figure 3-12-1: JTAG Interface Schematic

*Be careful not to hot plug the JTAG cable*

Figure 3-12-2: JTAG Interface on the Carrier Board

## Part 3.13: keys

The AX7A035 FPGA carrier board contains five user keys RESET, KEY1~KEY4, and all the keys are connected to the normal IO of the FPGA. The key is active low. When the key is pressed, the IO input voltage of the FPGA is low. When no key is pressed, The IO input voltage of the FPGA is high. The circuit of the key part is shown in Figure 3-13-1.

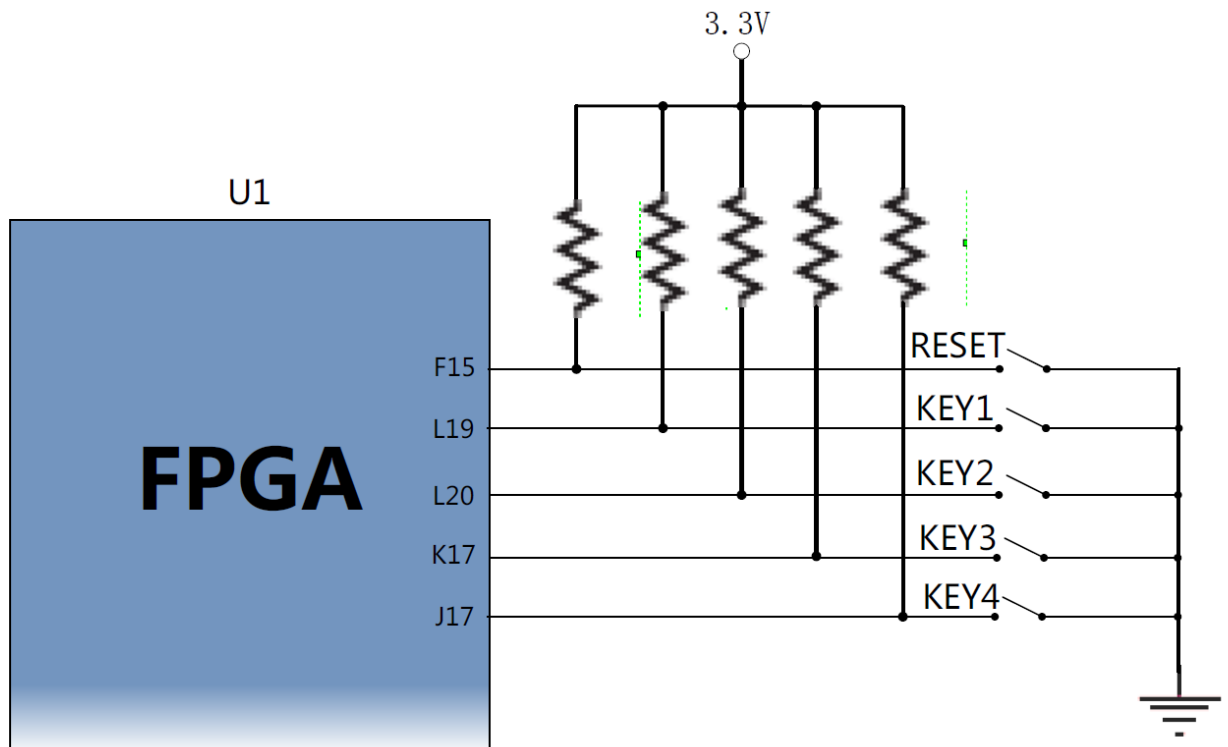

Figure 3-13-1: key Schematic

Figure 3-13-2: keys on the Carrier Board

### keys Pin Assignment

Net Name	FPGA PIN
RESET	F15
KEY1	L19
KEY2	L20
KEY3	K17
KEY4	J17

## Part 3.14: LED Light

There are 7 red LEDs on the AX7A035 FPGA carrier board, one of which is the power indicator (PWR), two are USB Uart data receiving and transmitting

indicators, and four are user LED lights (LED1~LED4). When the board is powered on, the power indicator will light up; User LED1~LED4 are connected to the normal IO of the FPGA. When the IO voltage connected to the user LED is configured low level, the user LED lights up. When the connected IO voltage is configured as high level, the user LED will be extinguished. The schematic diagram of the user LEDs hardware connection is shown in Figure 3-14-1.

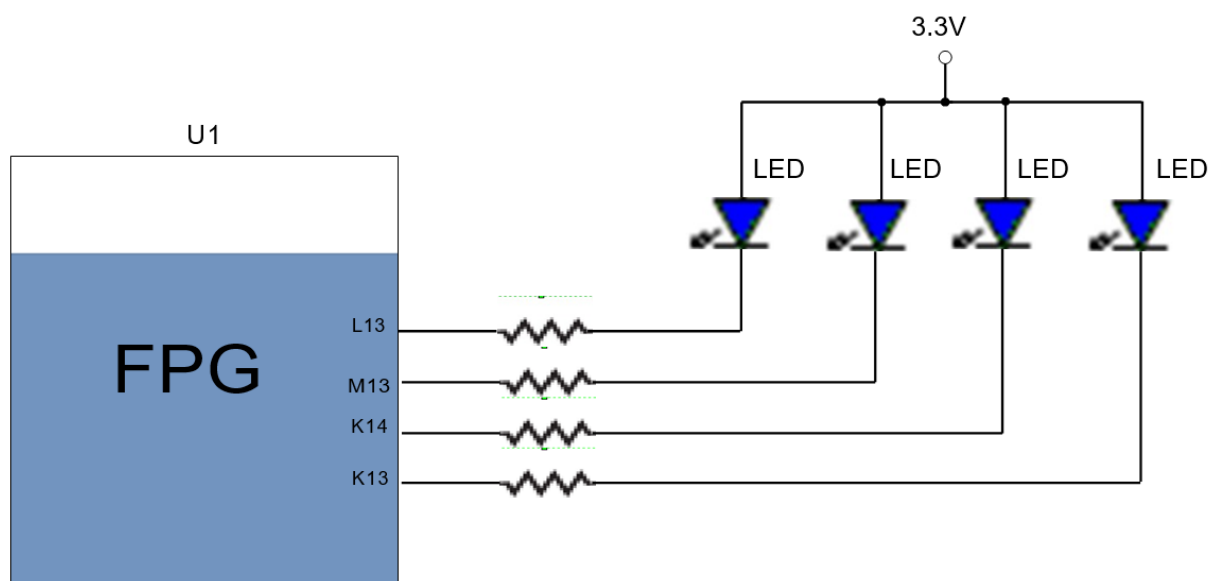

Figure 3-14-1: The User LED Schematic

Figure 3-14-2: The User LED on the Carrier Board

### Pin assignment of user LED lights

Signal Name	FPGA PIN
LED1	L13
LED2	M13
LED3	K14
LED4	K13

## Part 3.15: Power Supply

The power input voltage of the AX7A035 FPGA development board is DC12V. The development board also supports power from the PCIe interface.

At the same time, it supports direct power from the ATX chassis power supply (12V).

Figure 3-15-1: Power supply method for AX7A035 FPGA Board

The FPGA carrier board converts +12V voltage to +3.3V and +1.8V through two DC/DC power chip MP1482; one DC/DC power chip TPS54620 converts +12V voltage into +5V; one LDO power chip TPS74701 converts the +1.8V voltage to +1.2V. In addition, the +5V power supply on the carrier board supplies power to the core board through the inter-board connector. The power supply design on the carrier board is shown in Figure 3-15-2.

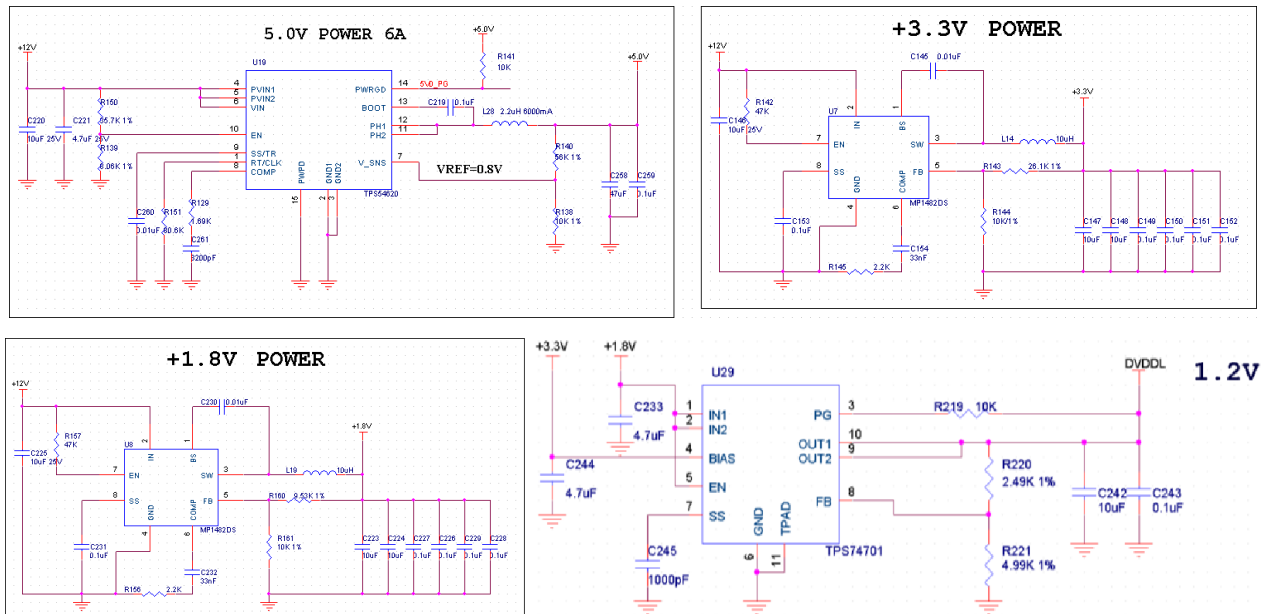

Figure 3-15-2: Power supply Schematic on the Carrier Board

Figure 3-15-3: Power Supply Circuit on the Carrier Board

## Part 3.16: Fan

Because the FPGA chip generates a lot of heat when it works normally, we add a heat sink and fan to the chip to prevent the chip from overheating. The fan is controlled by the FPGA chip. The control pin is connected to the IO of the BANK16. If the IO level output is low, the MOSFET is turned on, the fan operates, and if the IO level output is high, the fan stops. The fan design on the board is shown in Figure 3-16-1:

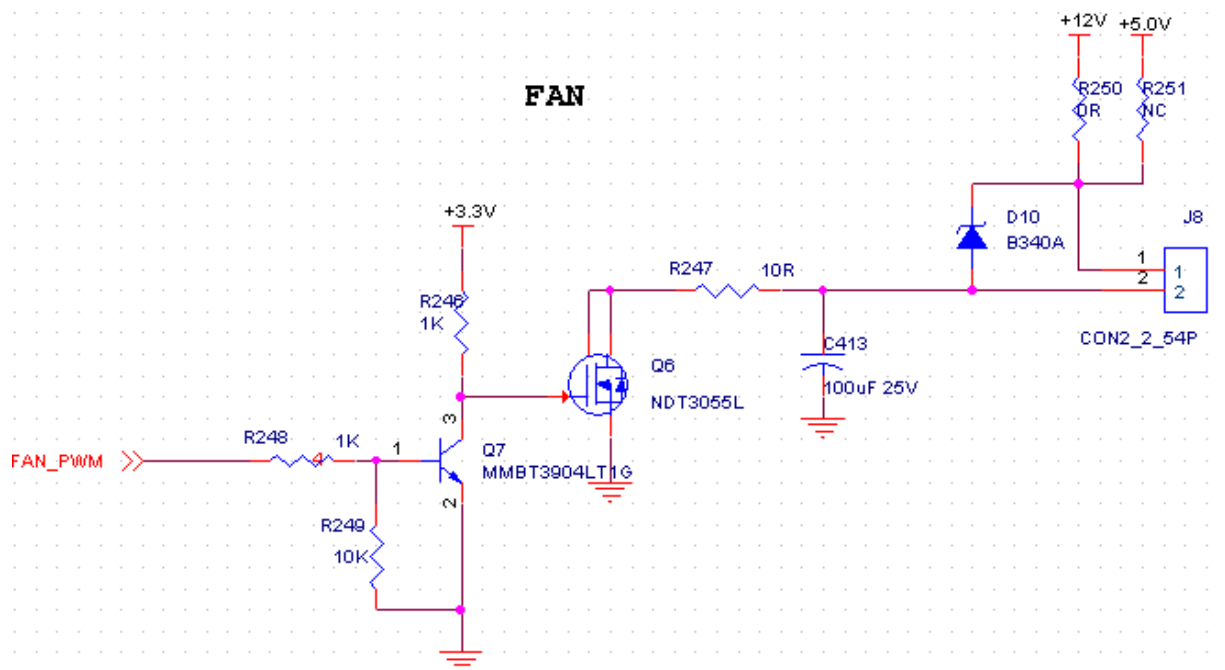

Figure 3-16-1: Fan design schematic

The fan has been screwed to the development board before leaving the factory. The power of the fan is connected to the J8 socket. The red is positive and the black is negative.

### Part 3.17: Carrier Board Size Dimension

Figure 3-17-1: Carrier Board Size Dimension
